2.2	React	11
2.3	Kubernetes	12

1. Communicative ability

1.1 Competence form

Explanation	You are sensitive, accessible and persuasive in your communications with various types of target groups, including clients. You consider the client's need your first priority, make clear arrangements and continuously check whether your performance has been satisfactory.
Sub-competencies	<ul style="list-style-type: none">- communicating- reporting- customer focus
Proof customer focus Reference to evidence in the portfolio: Name proof 1 related to "communicative ability": Communicative ability: 1.1	

1.2 Starr : communication with client to achieve best possible product.

The proof concerns: Creating application for a client and communicating interest.

The proof relates to: Section: 1.2.0: Communicative ability

Date proof: 20-05-2022

S	<p>Situation:</p> <p>A client for which I worked for at Basenet asked me to create a product inventaris. The client struggled to inventory their product. With strict ISO regulation in their sector keeping a tight inventory of products was necessary.</p>
T	<p>Task:</p> <p>Communicate on the best flow the application should have and how it's going to be used. It needs to be as easy as possible to add and remove products in the application.</p> <p>The user of the application shouldn't struggle with the usage as this will decrease the experience of the customer.</p>
A	<p>Activity:</p> <p>I came up with a design where the user has minimal interaction with the application.</p> <p>By listening to the wishes of the client I understood the process and the workflow of the user. Based on this data I created an experience where the user selects their location and is able to interact with the application by pressing buttons.</p>
R	<p>Result:</p> <p>By communicating with the client we achieved an experience that is designed around the user.</p>
R	<p>Reflection:</p> <p>The application will begin its first round of testing soon. With the test I expect there to be feedback.</p> <p>The application is currently designed around a process which I understood from a talk. With actual usage there could be lots of improvements to be made.</p>

2. Professional Competence

2.1 Competence form

Explanation	You have acquired knowledge and skills which are vital to your becoming an ICT professional. You are able to assess the knowledge you have gained for its relevance. You use this knowledge to make well-informed decisions on how to carry out assignments and solve the issues you may encounter in professional practice. In so doing, you work methodically, set criteria which must be met by the result, and work in accordance with professional (international) ICT standards. You have an enterprising attitude.
Sub-competencies	<ul style="list-style-type: none">- methodical approach- ability to apply (scientific) knowledge and insights- providing a high-quality product/service- showing an enterprising attitude.
Proof <p>This competency will always be assessed, both in your final project and in your final project report.</p> <p>Reference to evidence in the portfolio:</p> <p>Name proof 1 related to "professional competence": Professional Competence: Figure 2.1</p> <p>Name proof 2 related to "professional competence": Professional Competence: Figure 2.2</p> <p>Name proof 3 related to "professional competence": Professional Competence: Figure 2.3</p>	

2.2 Starr : Learning new skills to assist my current employer better.

The proof concerns: showing an enterprising attitude.

The proof relates to: Section: 2.2.0: Professional Competence

Date proof: 25-06-2022

S

Situation:

When the client for the inventory system came to me to create the application I had a choice which language to choose and which framework. I'm have more experience with for example with a normal old school deployment of applications. But to improve and assist my current employer more I decided to learn new skills that are actively used at VanMoof.

T

Task:

Look which software and skills are used at VanMoof and use this assignment to learn and apply those skills.

A

Activity:

At VanMoof we currently use a lot of kubernetes, terraform and other cloud related stuff. Also as a data engineer I have to create a lot of ETL's.

There are a lot of integrations and I looked for the most used and decided to improve upon those skills.

R

Result:

I came to the understanding that the most essential skills that I'm currently lacking are kubernetes and terraform.

I took and finished a courses about kubernetes, terraform and react and decided to use them in the application.

The result was an application build with those previously mentioned technologies. except for terraform, I will reflect on why in the next section.

R

Reflection:

I should have done better research on the usage of the technologies. Kubernetes and react fit well with the application context.

But terraform didn't, after learning and finishing the cursus I came to a better understanding of terraform. It's not a tool to manage network infrastructures but a tool to manages cloud infrastructures. This means that it is able to create cloud instances such as databases or secrets for a big organisation. It translates the code to actual products and creates them. For a single application there is no need to use terraform.

I'm now however able to support VanMoof with terraform by using the knowledge learned for the cursses.

CERTIFICATE OF COMPLETION

Complete React Developer in 2022 (w/ Redux, Hooks, GraphQL)

Instructors **Andrei Neagoie, Yihua Zhang, Zero To Mastery**

Jan Dorresteijn

Date **May 17, 2022**
Length **39 total hours**

Figure 2.2: React

Figure 2.3: Kubernetes

3. Research skills

3.1 Competence form

Explanation	You have an inquisitive attitude and tend to analyse various aspects of an issue or problem from various points of view. You collate relevant information from recognised sources. You analyse this information and systematically piece it together, using this method to arrive at an opinion and a solution. You are able to use different approaches to arrive at new ideas and solutions.
Sub-competencies	<ul style="list-style-type: none">- analysis and opinion forming- research- creativity
Proof This competency will always be assessed, both in your final project and in your final project report. Reference to evidence in the portfolio: Name proof 1 related to "research skills": Research skills: git repo	

3.2 Starr : Acquiring knowlegde

The proof concerns: analysis and opinion forming, research

The proof relates to: Section: 3.2.0: Research skills

Date proof: 14-05-2022

S

Situation:

To complete The application I have studied three cursuses.

- Kubernetes
- Terraform
- React

I already have experience with spring boot but not the GraphQL implementation.

I need to study the documentation to implement graphql in the backend.

T

Task:

Implement a graphql backend using spring boot.

A

Activity:

I first created a rest API. With this API I wanted to make sure the essential logic works.

When the authentication part was finished and I was able to create and login with user credentials I started working on the graphql implementation.

GraphQL makes use of A completely different approach then A rest API does. I learned a lot with the React cursus where there is also a section on GraphQL, but that was only the front-end implementation.

So still needed to dive into the documentation to implement the back-end in GraphQL.

R

Result:

The end result is a back-end and front-end that communicate with each other by the usage of GraphQL.

R

Reflection:

A rest implementation is in my opinion more straight forward. The implementation is linked based on an endpoint.

With a CRUD design the endpoint are easy to seperate and the development is straight forward.

Graphql uses schemes that are posted to the same end-point. I was quite unfamiliar with this new approach of designig a application.

The whole concept took some time to fully digest. But I think this application was an excelent learning experience with lots to still improve upon.

Reference:

The code of the application.

git repo

4. Capacity for Learning

4.1 Competence form

Explanation	You are able to reflect on your own performance and to identify your own strengths and weaknesses. You are receptive to other people's views and feedback and use them to grow as an ICT professional.
Sub-competencies	<ul style="list-style-type: none">- reflection- self-management
Proof reflection Reference to evidence in the portfolio: Name proof 1 related to "capacity for learning": Capacity for Learning: 4.2	

4.2 Starr : Do it well or not at all.

The proof concerns: reflection

The proof relates to: Section: 4.2.0: Capacity for Learning

Date proof: 22-05-22

S

Situation:

I moved from IntelliJ to Vim for my default editor. This led to misconfiguration which then leads to redundancy or mistakes.

T

Task:

Even when switching editor still maintain excellent code quality.

A

Activity:

With the new configuration for my Vim I skipped out on configuring lombok. Lombok is a tool that generates getters and setters. I should have configured my env in such a way I can still use lombok or delete the packages if I'm not going to use it.

R

Result:

I didn't reconfigure my configuration and still kept the lombok package. This led to a bloat jar file with unnecessary packages.

R

Reflection:

The whole process of setting up vim for Java development was quite a task. For example setting it up for python is straight forward (default language used at VanMoof). After a lot of tweaking I got it to work and didn't go the extra mile to achieve every feature. I should have removed the package or configured it good so it works.

Reference:

I can provide my dotfiles or provide access to the repository. But only to a single person. There are host configurations which I don't want on the WWW.

Will provide access if mail is provided to Vim configuration.
